

MGS 2005 Functional Reactive Programming

Lecture 1: Introduction to FRP, Yampa, and Arrows

Henrik Nilsson

School of Computer Science and Information Technology
University of Nottingham, UK

MGS 2005: FRP, Lecture 1 – p.1/36

Reactive programming

Reactive systems:

- Input arrives **incrementally** while system is running.
- Output is generated in response to input in an interleaved and **timely** fashion.

Contrast **transformational systems**.

The notions of

- time
- time-varying values, or **signals**

are inherent and central for reactive systems.

MGS 2005: FRP, Lecture 1 – p.3/36

Outline

- Brief introduction to FRP and Yampa
- Signal functions
- Arrows

MGS 2005: FRP, Lecture 1 – p.2/36

Functional Reactive Programming

What is Functional Reactive Programming (FRP)?

- Paradigm for reactive programming in a functional setting.
- Originated from Functional Reactive Animation (Fran) (Elliott & Hudak).
- Has evolved in a number of directions and into different concrete implementations.

MGS 2005: FRP, Lecture 1 – p.4/36

FRP applications

Some domains where FRP has been used:

- Graphical Animation (Fran: Elliott, Hudak)
- Robotics (Frob: Peterson, Hager, Hudak, Elliott, Pembeci, Nilsson)
- Vision (FVision: Peterson, Hudak, Reid, Hager)
- GUIs (Fruit: Courtney)
- Hybrid modeling (Nilsson, Hudak, Peterson)

MGS 2005: FRP, Lecture 1 – p.5/36

Related languages and paradigms

FRP related to:

- Synchronous languages, like Esterel, Lucid Synchrone.
- Modeling languages, like Simulink, Modelica.

MGS 2005: FRP, Lecture 1 – p.7/36

Key FRP features

- First class reactive components.
- Synchronous: all system parts operate in synchrony.
- Support for hybrid (mixed continuous and discrete time) systems.
- Allows dynamic system structure.

MGS 2005: FRP, Lecture 1 – p.6/36

Yampa

What is *Yampa*?

- The most recent Yale FRP implementation.
People:
 - Antony Courtney
 - Paul Hudak
 - Henrik Nilsson
 - John Peterson
- A Haskell **combinator library**, a.k.a. **Domain-Specific Embedded Language** (DSEL).

MGS 2005: FRP, Lecture 1 – p.8/36

Yampa

What is **Yampa**?

- Structured using **arrows**.
- **Continuous-time** signals (conceptually)
- Option type **Event** to handle discrete-time signals.
- Advanced **switching constructs** to describe systems with dynamic structure.

MGS 2005: FRP, Lecture 1 – p.9/36

Signal functions (1)

Key concept: **functions on signals**.

Intuition:

Signal $\alpha \approx \text{Time} \rightarrow \alpha$
 $x :: \text{Signal T1}$
 $y :: \text{Signal T2}$
 $f :: \text{Signal T1} \rightarrow \text{Signal T2}$

MGS 2005: FRP, Lecture 1 – p.11/36

Yampa?

Yampa is a river with long calmly flowing sections and abrupt whitewater transitions in between.

A good metaphor for hybrid systems!

MGS 2005: FRP, Lecture 1 – p.10/36

Signal functions (2)

Additionally, **causality** required: output at time t must be determined by input on interval $[0, t]$.

Signal functions are said to be

- **pure** or **stateless** if output at time t only depends on input at time t
- **impure** or **stateful** if output at time t depends on input over the interval $[0, t]$.

MGS 2005: FRP, Lecture 1 – p.12/36

Signal functions in Yampa

- **Signal functions** are **first class entities**.
Intuition: $SF\ \alpha\ \beta \approx Signal\ \alpha \rightarrow Signal\ \beta$
- **Signals** are **not** first class entities: they only exist indirectly through signal functions.

MGS 2005: FRP, Lecture 1 – p.13/36

Example: Video tracker

Video trackers are typically stateful signal functions:

MGS 2005: FRP, Lecture 1 – p.15/36

Signal functions and state

Alternative view:

Signal functions can encapsulate **state**.

$state(t)$ summarizes input history $x(t')$, $t' \in [0, t]$.
Thus, really a kind of **process**.

From this perspective, signal functions are:

- **stateful** if $y(t)$ depends on $x(t)$ and $state(t)$
- **stateless** if $y(t)$ depends only on $x(t)$

MGS 2005: FRP, Lecture 1 – p.14/36

Example: Robotics (1)

[PPDP'02, with Izzet Pembeci and Greg Hager, Johns Hopkins University]

Hardware setup:

MGS 2005: FRP, Lecture 1 – p.16/36

Example: Robotics (2)

Software architecture:

MGS 2005: FRP, Lecture 1 – p.17/36

Example: Robotics (3)

MGS 2005: FRP, Lecture 1 – p.18/36

Yampa and Arrows (1)

In Yampa, systems are described by combining signal functions (forming new signal functions).

For example, serial composition:

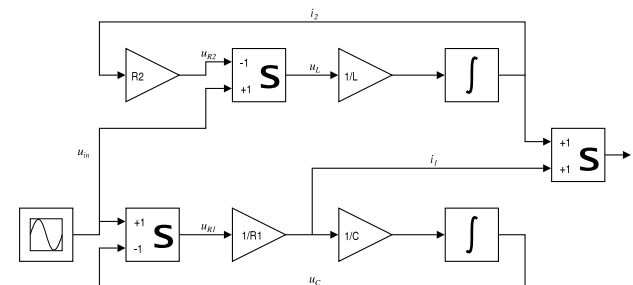

A *combinator* can be defined that captures this idea:

$(>>>) :: SF\ a\ b \rightarrow SF\ b\ c \rightarrow SF\ a\ c$

MGS 2005: FRP, Lecture 1 – p.19/36

Yampa and Arrows (2)

But systems can be complex:

How many and what combinators do we need to be able to describe arbitrary systems?

MGS 2005: FRP, Lecture 1 – p.20/36

Yampa and Arrows (3)

John Hughes' **arrow** framework:

- Abstract data type interface for function-like types.
- Particularly suitable for types representing process-like computations.
- Related to **monads**, since arrows are computations, but more general.
- Provides a minimal set of “wiring” combinators.

MGS 2005: FRP, Lecture 1 – p.21/36

What is an arrow? (2)

These diagrams convey the general idea:

MGS 2005: FRP, Lecture 1 – p.23/36

What is an arrow? (1)

- A **type constructor** a of arity two.
- Three operators:
 - **lifting**:
 $\text{arr} :: (b \rightarrow c) \rightarrow a\ b\ c$
 - **composition**:
 $(\gg) :: a\ b\ c \rightarrow a\ c\ d \rightarrow a\ b\ d$
 - **widening**:
 $\text{first} :: a\ b\ c \rightarrow a\ (b,d)\ (c,d)$
- A set of **algebraic laws** that must hold.

MGS 2005: FRP, Lecture 1 – p.22/36

The Arrow class

In Haskell, a **type class** is used to capture these ideas (except for the laws):

```
class Arrow a where
  arr    :: (b -> c) -> a b c
  (>>) :: a b c -> a c d -> a b d
  first :: a b c -> a (b,d) (c,d)
```

MGS 2005: FRP, Lecture 1 – p.24/36

Functions are arrows (1)

Functions are a simple example of arrows. The arrow type constructor is just (\rightarrow) in that case.

Exercise 1: Suggest suitable definitions of

- `arr`
- `(>>>)`
- `first`

for this case!

(We have not looked at what the laws are yet, but they are “natural”.)

MGS 2005: FRP, Lecture 1 – p.25/36

Functions are arrows (3)

- `f >>> g = \a -> g (f a)` **or**
- `f >>> g = g . f` **or even**
- `(>>>) = flip (.)`
- `first f = \ (b,d) -> (f b,d)`

MGS 2005: FRP, Lecture 1 – p.27/36

Functions are arrows (2)

Solution:

- `arr = id`
To see this, recall
`id :: t -> t`
`arr :: (b->c) -> a b c`

Instantiate with

`a = (->)`
`t = b->c = (->) b c`

MGS 2005: FRP, Lecture 1 – p.26/36

Functions are arrows (4)

Arrow instance declaration for functions:

```
instance Arrow (->) where
    arr      = id
    (>>>)    = flip (.)
    first f = \ (b,d) -> (f b,d)
```

MGS 2005: FRP, Lecture 1 – p.28/36

Arrow laws

```
(f >>> g) >>> h = f >>> (g >>> h)
arr (f >>> g) = arr f >>> arr g
arr id >>> f = f
                f = f >>> arr id
first (arr f) = arr (first f)
first (f >>> g) = first f >>> first g
```

Exercise 2: Draw diagrams illustrating the first and last law!

MGS 2005: FRP, Lecture 1 – p.29/36

The loop combinator (2)

Not all arrow instances support `loop`. It is thus a method of a separate class:

```
class Arrow a => ArrowLoop a where
  loop :: a (b, d) (c, d) -> a b c
```

Remarkably, the four combinators `arr`, `>>>`, `first`, and `loop` are sufficient to express any conceivable wiring!

MGS 2005: FRP, Lecture 1 – p.31/36

The loop combinator (1)

Another important operator is `loop`: a fixed-point operator used to express recursive arrows or **feedback**:

MGS 2005: FRP, Lecture 1 – p.30/36

Some more arrow combinators (1)

```
second :: Arrow a =>
  a b c -> a (d,b) (d,c)
```

```
(***) :: Arrow a =>
  a b c -> a d e -> a (b,d) (c,e)
```

```
(&&&) :: Arrow a =>
  a b c -> a b d -> a b (c,d)
```

MGS 2005: FRP, Lecture 1 – p.32/36

Some more arrow combinators (2)

As diagrams:

MGS 2005: FRP, Lecture 1 – p.35/36

Some more arrow combinators (3)

Exercise 3: Describe the following circuit using arrow combinators:

$a1, a2, a3 :: A \text{ Double Double}$

Exercise 4: The combinators `second`, `(***)`, and `(&&&)` are not primitive, but defined in terms of `arr`, `(>>>)`, and `first`. Suggest suitable definitions!
