Overview

- 1 Intro
- 2 Categories
- 3 Functors and natural transformations
- 4 Adjunctions
- 5 Products and coproducts
- 6 Exponentials
- 7 Limits and Colimits
- 8 Initial algebras and terminal coalgebras
- 9 Monads and Comonads

The category **Set**

Objects: Sets

$$|\mathbf{Set}| = \text{Set}$$

Morphisms : Functions, given $A, B \in |\mathbf{Set}|$

$$\mathbf{Set}(A, B) = A \rightarrow B$$

Identity: Given $A \in \text{Set}$

$$\text{id}_A \in \mathbf{Set}(A, A)$$

$$\text{id}_A = \lambda a.a$$

Composition: Given $f \in \mathbf{Set}(B, C), g \in \mathbf{Set}(A, B)$:

$$f \circ g \in \mathbf{Set}(A, C)$$

$$f \circ g = \lambda a.f(g a)$$

Laws:

$$f \circ \text{id} = f$$

$$\text{id} \circ f = f$$

$$(f \circ g) \circ h = f \circ (g \circ h)$$

Exercise 1

Derive the laws for **Set** using only the equations of the simply typed λ -calculus, i.e.

$$\beta \quad (\lambda x.t)u = t[x := u]$$

$$\eta \quad \lambda x.t x = t \text{ if } x \notin \text{FV } t$$

$$\xi \quad \frac{t = u}{\lambda x.t = \lambda x.u}$$

Definition: \mathbf{C} is a category
 A (large) set of objects:

$$|\mathbf{C}| \in \text{Set}_1$$

Morphisms: For every $A, B \in |\mathbf{C}|$ a *homset*

$$\mathbf{C}(A, B) \in \text{Set}$$

Identity: For any $A \in \mathbf{C}$:

$$\text{id}_A \in \mathbf{C}(A, A)$$

Composition: For $f \in \mathbf{C}(B, C), g \in \mathbf{C}(A, B)$:

$$f \circ g \in \mathbf{C}(A, C)$$

Laws:

$$f \circ \text{id} = f$$

$$\text{id} \circ f = f$$

$$(f \circ g) \circ h = f \circ (g \circ h)$$

Size matters

- I assume as given a predicative hierarchy of set-theoretic universes:

$$\mathbf{Set} = \mathbf{Set}_0 \in \mathbf{Set}_1 \in \mathbf{Set}_2 \in \dots$$

which is cumulative

$$\mathbf{Set}_0 \subseteq \mathbf{Set}_1 \subseteq \mathbf{Set}_2 \subseteq \dots$$

- To accommodate categories like **Set** we allow that the objects are a large set ($|\mathbf{C}| \in \mathbf{Set}_1$) but require the homsets to be proper sets $\mathbf{C}(A, B) \in \mathbf{Set} = \mathbf{Set}_0$.
- A category is *small*, if the objects are a set $|\mathbf{C}| \in \mathbf{Set}$
- We can repeat this definition at higher levels, a category at level n has as objects $|\mathbf{C}| \in \mathbf{Set}_{n+1}$ and homsets $\mathbf{C}(A, B) \in \mathbf{Set}_n$

Dual category

Given a category \mathbf{C} there is a dual category \mathbf{C}^{op} with

Objects $|\mathbf{C}^{\text{op}}| = |\mathbf{C}|$

Homsets $\mathbf{C}^{\text{op}}(A, B) = \mathbf{C}(B, A)$

and composition defined backwards.

Notation

For $n \in \mathbb{N}$ we define

$$\bar{n} = \{i < n\}$$

Question

How many elements are in $\mathbf{Set}(\bar{2}, \bar{3})$ and in $\mathbf{SET}^{\text{op}}(\bar{2}, \bar{3})$?

Isomorphism

An isomorphism between $A, B \in |\mathbf{C}|$ is given by two morphisms $f \in \mathbf{C}(A, B)$ and $f^{-1} \in \mathbf{C}(B, A)$ such that $f \circ f^{-1} = \text{id}$, $f^{-1} \circ f = \text{id}$:

$$\text{id} \circlearrowleft A \begin{array}{c} \xrightarrow{f} \\ \xleftarrow{f^{-1}} \end{array} B \circlearrowright \text{id}$$

We say that A and B are isomorphic $A \simeq B$.

- Isomorphic sets are the same upto a *renaming* of elements.
- Concepts in category theory are usually defined *up to isomorphism*.

Exercise 2

Which of the following isomorphisms hold in **Set**:

$$\bar{2} + \bar{2} \simeq \bar{4}$$

$$\bar{2} \times \bar{2} \simeq \bar{4}$$

$$\bar{2} \rightarrow \bar{2} \simeq \bar{4}$$

$$\mathbb{N} + \mathbb{N} \simeq \mathbb{N}$$

$$\mathbb{N} \times \mathbb{N} \simeq \mathbb{N}$$

$$\mathbb{N} \rightarrow \mathbb{N} \simeq \mathbb{N}$$

$A \times B$ is cartesian product

$$A \times B = \{(a, b) \mid a \in A, b \in B\}$$

$A + B$ is disjoint union

$$A + B = \{\text{inl } a \mid a \in A\} \cup \{\text{inr } b \mid b \in B\}$$

Monomorphism

$f \in \mathbf{C}(B, C)$ is a monomorphism (short *mono*), if for all $g, h \in \mathbf{C}(A, B)$

$$\frac{f \circ g = f \circ h}{g = h}$$

- In **Set** monos are precisely the injective functions.
- We draw monos as $A \dashrightarrow B$

Epimorphism

$f \in \mathbf{C}(A, B)$ is a epimorphism (short *epi*), if for all $g, h \in \mathbf{C}(B, C)$

$$\frac{g \circ f = h \circ f}{g = h}$$

- In **Set** epis are precisely the surjective functions.
- We draw epis as $A \twoheadrightarrow B$

Exercise 3

Show that every iso is both mono and epi.

- Assuming classical (non-constructive) logic, all bijections in **Set** are isos.

Exercise 4

Show that in **Set** every morphism $f \in A \rightarrow B$ can be written as a composition of an epi and a mono:

Monoids

Definition: Monoid

A monoid $(M, e, *)$ is given by $M \in \text{Set}$, $e \in M$ and $(*) \in M \rightarrow M \rightarrow M$ such that:

$$x * e = x$$

$$e * x = x$$

$$(x * y) * z = x * (y * z)$$

Example

$(\mathbb{N}, 0, +)$ is a (commutative) monoid.

Question

Give an example of a non-commutative monoid.

- Monoids correspond to categories with one object.

Monoid as a category

Every monoid $(M, e, *)$ gives rise to a category \mathbf{M}

Objects: $|\mathbf{M}| = \{()\}$

Morphisms $\mathbf{M}(() , ()) = M$

e is the identity, $*$ is composition.

Preorder

(A, \sqsubseteq) with $A \in \text{Set}$ and $(\sqsubseteq) \in A \rightarrow A \rightarrow \text{Prop}$ is a preorder if R is

reflexive $\forall a \in A. a \sqsubseteq a$

transitive $\forall a, b, c \in A. a \sqsubseteq b \rightarrow b \sqsubseteq c \rightarrow a \sqsubseteq c$

Example

(\mathbb{N}, \leq) is a preorder.

- (\mathbb{N}, \leq) is a partial order, because it also satisfies

$$\frac{m \leq n \quad n \leq m}{m = n}$$

Question

Give an example of a preorder, which is not a partial order.

- Preorders correspond to categories where the homsets have at most one element.

A preorder as a category

A preorder (A, \sqsubseteq) can be viewed as a category \mathbf{A} :

Objects $|\mathbf{A}| = A$

Homsets $\mathbf{A}(a, b) = \begin{cases} \{()\} & \text{if } a \sqsubseteq b \\ \{\} & \text{otherwise} \end{cases}$

- Monoids and preorders are degenerate categories.

Categories of sets with structure

The category of Monoids: **Mon**

Objects: Monoids $(M, e, *)$

Morphisms **Mon** $((M, e, *), (M', e', *'))$ is given by $f \in M \rightarrow M'$ such that $f e = e'$ and $f(x * y) = (f x) *' (f y)$.

Example

The embedding $i \in \mathbf{Mon}((\mathbb{N}, 0, +), (\mathbb{Z}, 0, +))$ with $i n = n$

Exercise 5

Show that i is a mono and an epi but not an iso in **Mon**.

Exercise 6

Define the category **Pre** of preorders and monotone functions.

Finite Sets

FinSet

Objects: Finite Sets

Morphisms: Functions

- **FinSet** is a full subcategory of **Set**.

FinSetSkel

Objects: \mathbb{N}

Morphisms: **FinSetSkel** $(m, n) = \bar{m} \rightarrow \bar{n}$

- **FinSetSkel** is skeletal, any isomorphic objects are equal.
- **FinSet** and **FinSetSkel** are equivalent (in the appropriate sense).

Computational Effects

Error

Given a set of Errors $E \in \text{Set}$

Objects: Sets

Morphisms: **Error** $(A, B) = A \rightarrow B + E$

State

Given a set of states: $S \in \text{Set}$

Objects: Sets

Morphisms: **State** $(A, B) = A \times S \rightarrow B \times S$

Exercise 7

Define identity and composition for both categories.

λ -terms

Lam

Objects: Finite sets of variables

Morphisms: $\mathbf{Lam}(X, Y) = Y \rightarrow \mathbf{Lam} X$ where $\mathbf{Lam} X$ is the set of λ -terms whose free variables are in X .

Exercise 8

- 1 Define identity and composition.
- 2 Extend the definition to typed λ -calculus.

Product categories

Given categories \mathbf{C} , \mathbf{D} we define $\mathbf{C} \times \mathbf{D}$:

Objects: $\mathbf{C} \times \mathbf{D}$

Morphisms: $\mathbf{C} \times \mathbf{D}((A, B), (C, D)) = \mathbf{C}(A, C) \times \mathbf{D}(B, D)$

We abbreviate $\mathbf{C}^2 = \mathbf{C} \times \mathbf{C}$

Slice categories

Given a category \mathbf{C} and an object $A \in |\mathbf{C}|$ we define \mathbf{C}/A as:

Objects: $|\mathbf{C}/A| = \Sigma B \in |\mathbf{C}|. \mathbf{C}(B, A)$

Morphisms: $\mathbf{C}/A((B, f), (C, g)):$

Computable sets

ω -Set

Objects: A Set A and a relation $\Vdash_A \subseteq \mathbb{N} \times A$ such that
 $\forall a \in A. \exists i \in \mathbb{N}. i \Vdash_A a$.

Morphisms:

$$\begin{aligned} \omega\text{-Set}((A, \Vdash_A), (B, \Vdash_B)) \\ = \{f \in A \rightarrow B \mid \exists i \in \mathbb{N}. \forall j, a. j \Vdash_A a \\ \rightarrow \exists k. \{i\}j \downarrow k \wedge k \Vdash_B f a\} \end{aligned}$$

where $\{i\}j \downarrow k$ means the i th Turing machine applied to input j terminates and returns k .

Partial computations

ω -CPO

Objects: $(A, \sqsubseteq_A, \bigsqcup_A)$ such that (A, \sqsubseteq_A) is a partial order, and

$$\bigsqcup_A \in \{f \in \mathbb{N} \rightarrow A \mid \forall i. f i \sqsubseteq_A f(i+1)\} \rightarrow A$$

is the least upper bound of a chain, i.e. $\forall i. f i \sqsubseteq \bigsqcup_A f$ and $(\forall i. f i \sqsubseteq a) \rightarrow \bigsqcup_A f \sqsubseteq a$.

Morphisms: ω -**CPO** $((A, \sqsubseteq_A, \bigsqcup_A), (B, \sqsubseteq_B, \bigsqcup_B))$ is given by functions $f \in A \rightarrow B$ which are:

$$\text{monotone} \quad \frac{a \sqsubseteq_A b}{f a \sqsubseteq f b}$$

$$\text{continuous} \quad f(\bigsqcup_A h) = \bigsqcup_B (f \circ h)$$

Definition: Functor

Given categories \mathbf{C} , \mathbf{D} a functor $F \in \mathbf{C} \rightarrow \mathbf{D}$ is given by

a map on objects $F \in |\mathbf{C}| \rightarrow |\mathbf{D}|$

maps on morphisms Given $f \in \mathbf{C}(A, B)$, $Ff \in \mathbf{D}(FA, FB)$

such that

$$\begin{aligned} F \text{id}_A &= \text{id}_{FA} \\ F(f \circ g) &= (Ff) \circ (Fg) \end{aligned}$$

- A functor $F \in \mathbf{C} \rightarrow \mathbf{C}$ is called an *endofunctor*.

Example

List : $\mathbf{Set} \rightarrow \mathbf{Set}$, the list functor on morphisms is given by map

$$\begin{aligned} \text{map } f \ [] &= [] \\ \text{map } f \ (a : as) &= f a : \text{map } f \ as \end{aligned}$$

We just write List $f = \text{map } f$.

Exercise 9

Show that `List` satisfies the functor laws.

Question

We consider endofunctors on **Set**, given maps on objects:

- 1 Is $F_1 X = X \rightarrow \mathbb{N}$ a functor?
 - 2 Is $F_2 X = X \rightarrow X$ a functor?
 - 3 Is $F_3 X = (X \rightarrow \mathbb{N}) \rightarrow \mathbb{N}$ a functor?
- All type expressions with only positive occurrences of a set variable give rise to (covariant) functors in **Set** \rightarrow **Set**.
 - All type expressions with only negative occurrences of a set variable give rise to (contravariant) functors in **Set**^{op} \rightarrow **Set**.

Exercise 10

Is there a type-expression which is not positive but still gives rise to a covariant endofunctor on **Set**?

Definition: natural transformation

Given functors $F, G \in \mathbf{C} \rightarrow \mathbf{D}$ a natural transformation $\alpha : F \rightarrow G$ is given by a family of maps

$$\alpha \in \prod_{A \in |\mathbf{C}|} \mathbf{D}(F A, G A)$$

such that for any $f \in \mathbf{C}(A, B)$

$$\begin{array}{ccc} F A & \xrightarrow{\alpha_A} & G A \\ F f \downarrow & & \downarrow G f \\ F B & \xrightarrow{\alpha_B} & G B \end{array}$$

Exercise 11

- 1 Show that $\text{reverse} \in \prod X \in \text{Set}. \text{List } X \rightarrow \text{List } X$ is a natural transformation.
- 2 Give a family of maps with the same type, which is not natural.

Functor categories

Given categories \mathbf{C} , \mathbf{D} the functor category $\mathbf{C} \rightarrow \mathbf{D}$ is given by:

Objects: Functors $F \in \mathbf{C} \rightarrow \mathbf{D}$

Morphisms Given $F, G \in \mathbf{C} \rightarrow \mathbf{D}$, a morphism is a natural transformation $\alpha \in F \rightarrow G$

- If \mathbf{C} is small, the functor category

$$\mathbf{PSh} \mathbf{C} = \mathbf{C}^{\text{op}} \rightarrow \mathbf{Set}$$

is called *the category of presheaves over \mathbf{C}* .

Exercise 12

Spell out the details of the objects and morphisms of $\mathbf{PSh}(\mathbb{N}, \leq)$.

We define a functor Y , the Yoneda embedding:

$$Y \in \mathbf{C} \rightarrow \mathbf{PSh C}$$
$$Y A = \lambda X. \mathbf{C}(X, A)$$

Exercise 13

Show that Y is a functor.

The Yoneda Lemma

Given $F \in \mathbf{PSh C}$ the following are naturally isomorphic in $A \in |\mathbf{C}|$

$$\mathbf{PSh C}(Y A, F) \simeq F A$$

Exercise 14

Prove the Yoneda Lemma.

The category of categories

CAT

The category of categories is given by:

Objects: Categories

Morphisms: Functors

- This is a category on level 1, $|\mathbf{CAT}| \in \text{Set}_2$.
- **CAT** is a 2-category because its homsets are categories themselves (+ Godemont rules).

Free Monoids

- The forgetful functor:

$$U \in \mathbf{Mon} \rightarrow \mathbf{Set}$$

$$U(M, e, *) = M$$

- Can we go the other way?
- The free functor:

$$F \in \mathbf{Set} \rightarrow \mathbf{Mon}$$

$$F A = (\text{List } A, [], (++))$$

- How to specify that F is *free*?

We construct two natural families of maps:

$$\mathbf{Mon}(F A, (M, e, *)) \begin{array}{c} \xrightarrow{\phi} \\ \xleftarrow{\phi^{-1}} \end{array} \mathbf{Set}(A, U(M, e, *))$$

$$\phi \in (\mathbf{List} A \rightarrow M) \rightarrow A \rightarrow M$$

$$\phi f a = f [a]$$

$$\phi^{-1} \in (A \rightarrow M) \rightarrow (\mathbf{List} A \rightarrow M)$$

$$\phi^{-1} g [] = e$$

$$\phi^{-1} g (a :: as) = (g a) * (\phi^{-1} g as)$$

Exercise 15

Show:

- 1 $\phi \circ \phi^{-1} = \text{id}$

- 2 $\phi^{-1} \circ \phi = \text{id}$

Definition: Adjunction

Given functors:

$$\mathbf{C} \begin{array}{c} \xrightarrow{U} \\ \xleftarrow{F} \end{array} \mathbf{D}$$

we say that F is left adjoint to U ($F \dashv U$)

or U is right adjoint to F

if there is a natural isomorphism (in $A \in |\mathbf{D}|, B \in |\mathbf{C}|$)

$$\mathbf{D}(F A, B) \begin{array}{c} \xrightarrow{\phi} \\ \xleftarrow{\phi^{-1}} \end{array} \mathbf{C}(A, U B)$$

A semilattice (with zero) is a monoid $(M, e, *)$ such that:
commutative , if for all $x, y \in M$:

$$x * y = y * x$$

idempotent , if for all $x \in M$:

$$x * x = x$$

- We define **SLat** as the category of semilattices with zero.
- Morphisms and forgetful functors are defined as for **Mon**

Exercise 16

Construct the free functor $F \in \mathbf{Set} \rightarrow \mathbf{SLat}$ and show that F is left adjoint to $U \in \mathbf{SLat} \rightarrow \mathbf{Set}$.

Products in Set

$$A \times B = \{(a, b) \mid a \in A, b \in B\}$$

$$\pi_0(a, b) = a$$

$$\pi_1(a, b) = b$$

$$\langle f, g \rangle \circ c = (f c, g c)$$

Laws:

$$\pi_0 \circ \langle f, g \rangle = f$$

$$\pi_1 \circ \langle f, g \rangle = g$$

$$\pi_0 \circ h = f \quad \pi_1 \circ h = g$$

$$h = \langle f, g \rangle$$

Products

Given objects $A, B \in |\mathbf{C}|$ we say that $A \times B$ is their product if the morphisms π_0, π_1 exists and for every f, g there is a morphism $\langle f, g \rangle$ so that the following diagram commutes:

$$\begin{array}{ccccc}
 & & C & & \\
 & \swarrow & \downarrow & \searrow & \\
 & f & \langle f, g \rangle & g & \\
 A & \xleftarrow{\pi_0} & A \times B & \xrightarrow{\pi_1} & B
 \end{array}$$

Moreover, the morphism $\langle f, g \rangle$ is the unique morphism which makes this diagram commute, i.e.

$$\frac{\pi_0 \circ h = f \quad \pi_1 \circ h = g}{h = \langle f, g \rangle}$$

Exercise 17

Show that products in \mathbf{C} give rise to a functor $(\times) \in \mathbf{C}^2 \rightarrow \mathbf{C}$.

Exercise 18

Show that the following equation holds

$$\langle f, g \rangle \circ h = \langle f \circ h, g \circ h \rangle$$

Exercise 19

Show that the following isomorphism exist in all categories with products:

$$A \times B \simeq B \times A$$

and that the assignment is natural in A, B .

Coproducts in **Set**

$$A + B = \{\text{inl } a \mid a \in A\} \cup \{\text{inr } b \mid b \in B\}$$

$$[f, g](\text{inl } a) = f a$$

$$[f, g](\text{inr } b) = g b$$

Laws:

$$[f, g] \circ \text{inl} = f$$

$$[f, g] \circ \text{inr} = g$$

$$h \circ \text{inl} = f \quad h \circ \text{inr} = g$$

$$h = [f, g]$$

Coproducts

Given objects $A, B \in |\mathbf{C}|$ we say that $A + B$ is their coproduct if the morphisms inl, inr exists and for every f, g there is a morphism $[f, g]$ so that the following diagram commutes:

$$\begin{array}{ccccc}
 & & C & & \\
 & f \nearrow & \uparrow & \nwarrow g & \\
 A & \xrightarrow{\text{inl}} & A + B & \xleftarrow{\text{inr}} & B
 \end{array}$$

Moreover, the morphism $[f, g]$ is the unique morphism which makes this diagram commute, i.e.

$$\frac{h \circ \text{inl} = f \quad h \circ \text{inr} = g}{h = [f, g]}$$

- Products and coproducts are dual concepts:
Products in $|\mathbf{C}|$ are coproducts in $|\mathbf{C}^{\text{op}}|$ and vice versa.
- Products and coproducts are left and right adjoints of the diagonal functor:

$$\Delta \in \mathbf{C} \rightarrow \mathbf{C}^2$$

$$\Delta A = (A, A)$$

Terminal objects

$1 \in |\mathbf{C}|$ is a terminal object, if for any object $A \in \mathbf{C}$ there is exactly one arrow $!_A$:

$$A \xrightarrow{!_A} 1$$

Initial objects

$0 \in |\mathbf{C}|$ is an initial object, if for any object $A \in \mathbf{C}$ there is exactly one arrow $?_A$:

$$0 \xrightarrow{?_A} A$$

Question

What are initial and terminal objects in **Set**?

Exercise 20

Show that any two terminal objects are isomorphic.

Global elements

- In **Set** we have that

$$\mathbf{Set}(1, A) \simeq A$$

- Hence the elements of $\mathbf{C}(1, A)$ are called the **global elements** of A .
- A category \mathbf{C} is *well pointed*, if for $f, g \in \mathbf{C}(A, B)$ we have

$$\frac{\forall a \in \mathbf{C}(1, A). f \circ a = g \circ a}{f = g}$$

- **Set** is well pointed.

Exercise 21

Consider $\mathbf{PSh}(\mathbb{N}, \leq)$ again. What is the terminal object and what are global elements? Show that $\mathbf{PSh}(\mathbb{N}, \leq)$ is not well pointed.

Exercise 22

Construct the following isomorphism in **Set**:

$$A \times (B + C) \simeq A \times B + A \times C$$

Exercise 23

Show that **CMon** (the category of commutative monoids) has products and coproducts.

Exercise 24

Give a counterexample for the isomorphism:

$$A \times (B + C) \simeq A \times B + A \times C$$

in **CMon**.

Exponentials in **Set**

- In **Set** we have the curry/uncurry isomorphism:

$$A \times B \rightarrow C \simeq A \rightarrow (B \rightarrow C)$$

- Indeed this is an adjunction $F \dashv G$ for

$$F, G \in \mathbf{Set} \rightarrow \mathbf{Set}$$

$$F X = X \times B$$

$$G X = B \rightarrow X$$

$$\mathbf{Set}(F A, C) \simeq \mathbf{Set}(A, G C)$$

Exponentials

Given a category \mathbf{C} with products. We say that the object $B \in |\mathbf{C}|$ is exponentiable, if the functor $F X = X \times B$ has a right adjoint $F \dashv G$, which we write as $G X = B \rightarrow X$.

A category with products where all objects are exponentiable is called **cartesian closed**.

- $B \rightarrow C$ is often written as C^B .

Question

What are the exponentials in **FinSetSkel**?

Exercise 25

Show that the category of typed λ -terms is cartesian closed.

- Indeed, this is the initial cartesian closed category (or the classifying category).

Exercise 26

Show that in a cartesian closed category with coproducts we have that

$$A \times (B + C) \simeq (A \times B) + (A \times C)$$

Corollary

CMon *is not cartesian closed.*

Exercise 27

Show that the presheaf categories (**PSh C**) are cartesian closed.

Exercise 28

Is there a cartesian closed category whose dual is also cartesian closed?

Pullbacks

Given arrows $f \in \mathbf{C}(A, C)$ and $g \in \mathbf{C}(B, C)$, $(f \times_C g, \pi_0, \pi_1)$ is their pullback, if the diagram below commutes and for every (D, p_0, p_1) there is a unique arrow $\langle p_0, p_1 \rangle$ such that the diagram commutes:

- Pullbacks in **Set**:

$$f \times_C g = \{(a, b) \in A \times B \mid f a = g b\}$$

Pushouts

Given arrows $f \in \mathbf{C}(A, B)$ and $g \in \mathbf{C}(A, C)$, $(f +^A g, \text{inl}, \text{inr})$ is their pushout, if the diagram below commutes and for every (D, i_0, i_1) there is a unique arrow $[p_0, p_1]$ such that the diagram commutes:

Exercise 29

What are pushouts in **Set**?

Limits and colimits

Given a small category of diagrams \mathbf{D} , a \mathbf{D} -diagram in \mathbf{C} is given by a functor $F \in \mathbf{D} \rightarrow \mathbf{C}$. A cone of a diagram is given by an object $D \in \mathbf{C}$ and a natural transformation $\alpha \in \mathbf{K}_D \rightarrow F$ where $\mathbf{K}_D X = D$ is a constant functor.

Morphisms between cones (D, α) and (E, β) are given by $f \in D \rightarrow E$ such that $\alpha \circ f = \beta$.

The limit of F is the terminal object in the category of cones.

Dually, a cocone is given by a natural transformation $\alpha \in F \rightarrow \mathbf{K}_D$, and a morphism of cocones (D, α) and (E, β) are given by $f \in D \rightarrow E$ such that $f \circ \alpha = \beta$.

The colimit of F is the initial object in the category of cocones.

Examples

- Products are given by limits of

Note that we are leaving out identity arrows.

- Dually, coproducts are given by colimits of the same diagram.
- Pullbacks are limits of

- Pushouts are colimits of the dual diagram:

- Equalizers are limits of

- Dually, coequalizers are colimits of the same diagram.

Exercise 30

What are equalizers and coequalizers in **Set**?

Exercise 31

Show that pullbacks can be constructed from equalizers and products.

- Actually, all finite limits can be constructed from equalizers and finite products (i.e. binary products and terminal objects).

- Diagrams of (\mathbb{N}, \leq) are called ω -chains:

$$A_0 \xrightarrow{a_0} A_1 \xrightarrow{a_1} A_2 \xrightarrow{a_2} \dots$$

Note that we are leaving out the composites of arrows.

- An ω -chain in **Set** is given by

$$A \in \mathbb{N} \rightarrow \text{Set}$$

$$a \in \prod_{n \in \mathbb{N}} A_n \rightarrow A_{(n+1)}$$

- We write $\text{colim}(A, a)$ for the colimit of an ω -chain.

Exercise 32

What is the colimit of the following chain?

$$A_n = \bar{n}$$

$$a_{ni} = i$$

- Dually, Diagrams of (\mathbb{N}, \geq) are called ω -cochains:

$$A_0 \xleftarrow{a_0} A_1 \xleftarrow{a_1} A_2 \xleftarrow{a_2} \dots$$

- An ω -cochain in **Set** is given by

$$A \in \mathbb{N} \rightarrow \text{Set}$$

$$a \in \prod_{n \in \mathbb{N}} A(n+1) \rightarrow A_n$$

- We write $\lim(A, a)$ for the limit of an ω -cochain.

Exercise 33

Given a set $X \in \text{Set}$. What is the limit of the following chain?

$$A_n = \bar{n} \rightarrow X$$

$$anf = \lambda i.f i$$

- Natural numbers $\mathbb{N} \in \text{Set}$ are given by:

$$0 \in \mathbb{N}$$

$$\simeq 1 \rightarrow \mathbb{N}$$

$$S \in \mathbb{N} \rightarrow \mathbb{N}$$

- We can combine the two constructors in one morphism:

$$[0, S] \in 1 + \mathbb{N} \rightarrow \mathbb{N}$$

- The functor $T X = 1 + X$ is called the signature functor.
- A pair $(A \in \text{Set}, f \in 1 + A \rightarrow A)$ is a $1+$ -algebra.

- For any $1+$ -algebra (A, f) there is a unique morphism $\text{fold}(A, f)$ such that the following diagram commutes:

$$\begin{array}{ccc}
 1 + \mathbb{N} & \xrightarrow{[0, S]} & \mathbb{N} \\
 \downarrow 1+(\text{fold}(A, f)) & & \downarrow \text{fold}(A, f) \\
 1 + A & \xrightarrow{f} & A
 \end{array}$$

with

$$\begin{aligned}
 \text{fold}(A, f) 0 &= f(\text{inl}()) \\
 \text{fold}(A, f) (S n) &= f(\text{inr}(\text{fold}(A, f) n))
 \end{aligned}$$

Exercise 34

Define addition $(+) \in \mathbb{N} \rightarrow \mathbb{N} \rightarrow \mathbb{N}$ using fold.

T -algebras

Given an endofunctor $T \in \mathbf{C} \rightarrow \mathbf{C}$ the category of T -algebras is given by

Objects T -algebras (A, f) with

$$T A \xrightarrow{f} A$$

Morphisms Given T -algebras $(A, f), (B, g)$ a T -algebra morphism is a morphism $h \in \mathbf{C}(A, B)$ such that

$$\begin{array}{ccc} T A & \xrightarrow{f} & A \\ T h \downarrow & & \downarrow h \\ T B & \xrightarrow{g} & B \end{array}$$

commutes.

Initial T -algebras

The initial object (if it exists) in the category of T -algebras is denoted as $(\mu T, \text{in}_T)$. For every T -algebra (A, f) there is a unique morphism $\text{fold}_T(A, f)$ such that

$$\begin{array}{ccc}
 T(\mu T) & \xrightarrow{\text{in}_T} & \mathbb{N} \\
 T(\text{fold}(A, f)) \downarrow & & \downarrow \text{fold}(A, f) \\
 T A & \xrightarrow{f} & A
 \end{array}$$

commutes.

- Given $A \in \text{Set}$ the set of streams over A : A^ω comes with two destructors

$$\text{hd} \in A^\omega \rightarrow A$$

$$\text{tl} \in A^\omega \rightarrow A^\omega$$

- We can combine the two destructors in one morphism:

$$\langle \text{hd}, \text{tl} \rangle \in A^\omega \rightarrow A \times A^\omega$$

- A pair $(X \in \text{Set}, f \in X \rightarrow A \times X)$ is a $A \times$ -coalgebra.

- For any $A \times$ -algebra (X, f) there is a unique morphism $\text{unfold}(X, f)$ such that the following diagram commutes:

$$\begin{array}{ccc}
 X & \xrightarrow{f} & A \times X \\
 \text{unfold}(X, f) \downarrow & & \downarrow A \times \text{unfold}(X, f) \\
 A^\omega & \xrightarrow{\langle \text{hd}, \text{tl} \rangle} & A \times A^\omega
 \end{array}$$

with

$$\text{hd}(\text{unfold}(X, f) x) = \pi_0(f x)$$

$$\text{tl}(\text{unfold}(X, f) x) = \text{unfold}(X, f) (\pi_1(f x))$$

Exercise 35

Define the function $\text{from} : \mathbb{N} \rightarrow \mathbb{N}^\omega$, which produces the stream of natural numbers starting with a given number, using unfold .

T -coalgebras

Dually, given an endofunctor $T \in \mathbf{C} \rightarrow \mathbf{C}$ the category of T -coalgebras is given by

Objects T -coalgebras (A, f) with

$$A \xrightarrow{f} T A$$

Morphisms Given T -coalgebras $(A, f), (B, g)$ a T -coalgebra morphism is a morphism $h \in \mathbf{C}(A, B)$ such that

$$\begin{array}{ccc} A & \xrightarrow{f} & T A \\ h \downarrow & & \downarrow T h \\ B & \xrightarrow{g} & T B \end{array}$$

commutes.

Terminal T -coalgebras

The terminal object (if it exists) in the category of T -coalgebras is denoted as $(\nu T, \text{out}_T)$. For every T -coalgebra (A, f) there is a unique morphism $\text{unfold}_T(A, f)$ such that

$$\begin{array}{ccc}
 A & \xrightarrow{f} & TA \\
 \text{unfold}(A, f) \downarrow & & \downarrow T(\text{unfold}(X, f)) \\
 \nu T & \xrightarrow{\text{out}_T} & T(\nu T)
 \end{array}$$

Lambek's lemma

- Initial algebras and terminal coalgebras are always isomorphisms.
- We construct the inverse of $\text{in}_T \in \mathbf{C}(T(\mu T), \mu T)$ as

$$\text{in}_T^{-1} \in \mathbf{C}(\mu T, T(\mu T))$$

$$\text{in}_T^{-1} = \text{fold}_T(T(\mu T), T \text{in}_T)$$

- Dually, we construct an inverse to out_T .

Exercise 36

Construct explicitly the inverses to the $[0, S]$ and $\langle \text{hd}, \text{tl} \rangle$.

Exercise 37

Prove Lambek's lemma, i.e. show that in_T^{-1} is inverse to in_T .

- A functor T is called ω -cocontinuous if it preserves colimits of ω -chains, that is

$$T(\operatorname{colim}(A, a)) \simeq \operatorname{colim}(\lambda n. T(A_n), \lambda n. T(a_n))$$

- We can construct the initial T -algebra of an ω -cocontinuous functor T by constructing the colimit of the following chain:

$$0 \xrightarrow{?} T0 \xrightarrow{T?} T^2 0 \xrightarrow{T^2?} \dots$$

Exercise 38

Complete the construction, and show that the colimit is indeed an initial T -algebra.

Exercise 39

Dualize the previous slide. What is an ω -continuous functor? How can we construct its terminal coalgebra?

Exercise 40

Which of the following endofunctors on Set are ω -cocontinuous, and which are ω -continuous:

$$T_1 X = X \times X$$

$$T_2 X = \mathbb{N} \rightarrow X$$

$$T_3 X = (X \rightarrow \mathbb{N}) \rightarrow \mathbb{N}$$

- We define the functor of binary trees with labelled leaves:

$$BT \in \mathbf{Set} \rightarrow \mathbf{Set}$$

$$BT X = \mu Y. X + Y \times Y$$

We write $L = \text{in} \circ \text{inl}$ and $N = \text{in} \circ \text{inr}$ for the constructors.

- The natural transformation η constructs a leaf:

$$\eta_A \in A \rightarrow BT A$$

$$\eta_A = \lambda a. L a$$

- We define a natural transformation bind , which replaces each leaf by a tree.

$$\text{bind}_{A,B} \in (A \rightarrow BT B) \rightarrow BT A \rightarrow BT B$$

$$\text{bind}_{A,B} f (L a) = f a$$

$$\text{bind}_{A,B} f (N (l, r)) = N (\text{bind}_{A,B} f l, \text{bind}_{A,B} f r)$$

- Haskell's $(>>=)$ can be defined as $a >>= f = \text{bind } f a$.

Monads (Kleisli triple)

A monad on \mathbf{C} is a triple (T, η, bind) with

$$\begin{aligned}T &\in \mathbf{C} \rightarrow \mathbf{C} \\ \eta &\in \mathbf{C}(A, T A) \\ \text{bind} &\in \mathbf{C}(A, T B) \rightarrow \mathbf{C}(T A, T B)\end{aligned}$$

such that

$$\begin{aligned}(\text{bind } f) \circ \eta &= f \\ \text{bind } (\eta \circ f) &= f \\ (\text{bind } f) \circ (\text{bind } g) &= \text{bind } ((\text{bind } f) \circ g)\end{aligned}$$

Exercise 41

Show that the operations on binary trees satisfy the laws of a monad.

Exercise 42

Show that the following functors over **Set** give rise to monads (assuming $E, S \in \mathbf{Set}$):

$$T_{\text{Error}} X = E + X$$

$$T_{\text{State}} X = S \rightarrow (X \times S)$$

Monad

A monad on \mathbf{C} is a triple (T, η, μ) with

$$T \in \mathbf{C} \rightarrow \mathbf{C}$$

$$\eta \in I \rightarrow T$$

$$\mu \in T^2 \rightarrow T$$

(where $T^2 = T \circ T$) such that the following diagrams commute.

$$\begin{array}{ccc}
 T & \xrightarrow{\eta T} & T^2 \\
 T\eta \downarrow & \searrow & \downarrow \mu \\
 T^2 & \xrightarrow{\mu} & T
 \end{array}
 \qquad
 \begin{array}{ccc}
 T^3 & \xrightarrow{T\mu} & T^2 \\
 \mu T \downarrow & & \downarrow \mu \\
 T^2 & \xrightarrow{\mu} & T
 \end{array}$$

Exercise 43

Show that the two definitions are equivalent.

- We define infinite, labelled binary trees:

$$BT^\infty \in \mathbf{Set} \rightarrow \mathbf{Set}$$

$$BT^\infty X = \nu Y. X \times (Y \times Y)$$

- The operation ϵ extracts the top label:

$$\epsilon \in BT^\infty A \rightarrow A$$

$$\epsilon(a, (l, r)) = a$$

- cobind relabels a tree recursively:

$$\text{cobind} \in (BT^\infty A \rightarrow B) \rightarrow (BT^\infty A \rightarrow BT^\infty B)$$

$$\text{cobind } f t = (f t, \text{cobind } f (\pi_2 t), \text{cobind } f (\pi_3 t))$$

Exercise 44

Show that $(BT^\infty, \epsilon, \text{cobind})$ is a comonad, i.e. a monad in \mathbf{Set}^{op} .

Kleisli category

Given a monad (T, η, bind) on \mathbf{C} we define the Kleisli category \mathbf{C}_T as:

Objects: $|\mathbf{C}|$

Morphisms: $\mathbf{C}_T A B = \mathbf{C}(A, T B)$

Identity: $\eta \in \mathbf{C}_T A A$

Composition: Given $f \in \mathbf{C}_T B C$, $g \in \mathbf{C}_T A B$ we define

$$f \circ_T g = (\text{bind } f) \circ g$$

Exercise 45

Verify that that \mathbf{C}_T is indeed a category.

Exercise 46

Explicitly construct the Kleisli-categories of T_{Error} and T_{State}

Given an adjunction $F \dashv U$

$$\mathbf{D}(F A, B) \begin{array}{c} \xrightarrow{\phi} \\ \xleftarrow{\phi^{-1}} \end{array} \mathbf{C}(A, U B)$$

we define:

$$\eta \in \mathbf{C}(A, U(F A))$$

$$\eta = \phi(\text{id}_{F A})$$

$$\epsilon \in \mathbf{D}(F, U B)B$$

$$\epsilon = \phi^{-1}(\text{id}_{U B})$$

this gives rise to a monad (T, ϵ, μ) on \mathbf{C}

$$T = UF$$

$$\mu = U\epsilon F$$

Exercise 47

Spell out the constructed monad in the case where $F \in \mathbf{Set} \rightarrow \mathbf{Mon}$ is the free monad functor and $U \in \mathbf{Mon} \rightarrow \mathbf{Set}$ the forgetful functor

Exercise 48

Verify the monad laws of the construction of a monad from an adjunction.

- Using \mathbf{C}_T we can also go the other way: \mathbf{C}_T gives rise to an adjunction $F_T \dashv U_T$ such that $T = U_T \circ F_T$:

$$F_T \in \mathbf{C} \rightarrow \mathbf{C}_T$$

$$F_T A = A$$

$$F_T f = \eta \circ f$$

$$U_T \in \mathbf{C}_T \rightarrow \mathbf{C}$$

$$U_T A = T A$$

$$U_T f = \mu \circ T f$$

Exercise 49

Verify that $F_T \dashv U_T$.

- This is not the only way to factor a monad into an adjunction. Another construction is the Eilenberg-Moore category \mathbf{C}^T , indeed the two are initial and terminal objects in the category of factorisations.
