

**Table I.** The general form of the payoff function in the prisoner's dilemma, where  $\gamma_1$  is the payoff to each player for mutual cooperation,  $\gamma_2$  is the payoff for cooperating when the other player defects,  $\gamma_3$  is the payoff for defecting when the other player cooperates, and  $\gamma_4$  is the payoff for mutual defection. An entry  $(\alpha, \beta)$  indicates the payoffs to players A and B, respectively.

**Table II**. The specific payoff function used in [12].

**Table III**. Tabulated results of the 20 trials in each setting. The columns represent: (a) the number of trials that generated cooperative behavior after the 10<sup>th</sup> generation, (b) the number of trials that demonstrated a trend toward increasing mean payoffs, (c) the number of trials that demonstrated a trend toward decreasing mean payoffs, (d) the number of trials that generated persistent universal complete defection after the 200<sup>th</sup> generation, and (e) the number of trials that appeared to consistently generate some level of cooperative behavior (from [26]).

**Table IV.** The relevant categories of player indicated by the corresponding range of rating score.

## **Appendix**

This appendix contains the complete sequence of moves from two selected games where the best-evolved neural network from generation 230 defeated a human rated 2210 (master level) and also defeated a human rated 2024 (expert level). The notation for each move is given in the form a-b, where a is the position of the checker that will move and b is the destination. Forced moves (mandatory jumps or occasions where only one move is available) are indicated by (f). Accompanying the move sequences are two figures for each game indicating a pivotal position and the ending. The figures are referred to in the annotations.
