G52MAL Machines and Their Languages Lecture 11 Description Trees and Ambiguity

Derivation Trees and Ambiguity

Henrik Nilsson

University of Nottingham

Recap: Definition of CFG

A CFG G = (N, T, P, S) where

- N is a finite set of nonterminals (or variables or syntactic categories)
- T is a finite set of terminals
- $N \cap T = \emptyset$ (disjoint)
- P is a finite set of productions of the form A o lpha where $A \in N$ and $lpha \in (N \cup T)^*$
- $S \in N$ is the start symbol

Recap: The Directly Derives Relation (1)

To formally define the language generated by

$$G = (N, T, P, S)$$

we first define a binary relation \Rightarrow on strings over

 $N \cup T$, read "directly derives in grammar G", being the least relation such that

$$\alpha A \gamma \Rightarrow_{G} \alpha \beta \gamma$$

whenever $A \to \beta$ is a production in G where $A \in N$ and $\alpha, \beta, \gamma \in (N \cup T)^*$.

Recap: The Directly Derives Relation (2)

When it is clear which grammar G is involved, we use \Rightarrow instead of \Rightarrow .

Example: Given the grammar

$$\begin{array}{ccc} S & \to & \epsilon \mid aA \\ A & \to & bS \end{array}$$

we have

$$S \Rightarrow \epsilon$$
 $aA \Rightarrow abS$ $S \Rightarrow aA$ $SaAaa \Rightarrow SabSaa$

The relation $\underset{G}{\overset{*}{\Rightarrow}}$, read "*derives in grammar G*", is the reflexive, transitive closure of $\underset{G}{\overset{*}{\Rightarrow}}$.

That is, $\underset{G}{\overset{*}{\Rightarrow}}$ is the least relation on strings over $N \cup T$ such that:

The relation $\underset{G}{\overset{*}{\Rightarrow}}$, read "*derives in grammar G*", is the reflexive, transitive closure of $\underset{G}{\overset{*}{\Rightarrow}}$.

That is, $\underset{G}{\overset{*}{\Rightarrow}}$ is the least relation on strings over $N \cup T$ such that:

$$\alpha \stackrel{*}{\underset{G}{\Rightarrow}} \beta \quad \text{if} \quad \alpha \stackrel{*}{\underset{G}{\Rightarrow}} \beta$$

The relation $\underset{G}{\overset{*}{\Rightarrow}}$, read "*derives in grammar G*", is the reflexive, transitive closure of $\underset{G}{\overset{*}{\Rightarrow}}$.

That is, $\underset{G}{\overset{*}{\Rightarrow}}$ is the least relation on strings over $N \cup T$ such that:

$$\alpha \stackrel{*}{\underset{G}{\Rightarrow}} \beta \quad \text{if} \quad \alpha \stackrel{*}{\underset{G}{\Rightarrow}} \beta$$

$$\alpha \stackrel{*}{\Rightarrow} \alpha$$

(reflexive)

The relation $\underset{G}{\overset{*}{\Rightarrow}}$, read "*derives in grammar G*", is the reflexive, transitive closure of $\underset{G}{\overset{*}{\Rightarrow}}$.

That is, $\underset{G}{\overset{*}{\Rightarrow}}$ is the least relation on strings over $N \cup T$ such that:

$$\alpha \stackrel{*}{\underset{G}{\Rightarrow}} \beta \quad \text{if} \quad \alpha \stackrel{*}{\underset{G}{\Rightarrow}} \beta$$

$$\alpha \stackrel{*}{\underset{G}{\Rightarrow}} \alpha \qquad \qquad \text{(reflexive)}$$

$$\alpha \stackrel{*}{\Rightarrow} \beta$$
 if $\alpha \stackrel{*}{\Rightarrow} \gamma \wedge \gamma \stackrel{*}{\Rightarrow} \beta$ (transitive)

Again, we use $\stackrel{*}{\Rightarrow}$ instead of $\stackrel{*}{\Rightarrow}$ when G is obvious.

Example: Given the grammar

$$\begin{array}{ccc} S & \to & \epsilon \mid aA \\ A & \to & bS \end{array}$$

we have

$$S \stackrel{*}{\Rightarrow} \epsilon$$

$$S \stackrel{*}{\Rightarrow} aA$$

$$aA \stackrel{*}{\Rightarrow} abS$$

$$S \stackrel{*}{\Rightarrow} abS$$

$$S \stackrel{*}{\Rightarrow} ababS$$

$$S \stackrel{*}{\Rightarrow} abab$$

Recap: Lang. Generated by a Grammar

The *language generated* by a context-free grammar

$$G = (N, T, P, S)$$

denoted L(G), is defined as follows:

$$L(G) = \{ w \mid w \in T^* \land S \stackrel{*}{\underset{G}{\Rightarrow}} w \}$$

A language L is a Context-Free Language (CFL) iff L = L(G) for some CFG G.

A string $\alpha \in (N \cup T)^*$ is a *sentential form* iff $S \stackrel{*}{\Rightarrow} \alpha$.

Recap: Language Generation: Example

Given the grammar

$$G = (N = \{S, A\}, T = \{a, b\}, P, S)$$
 where P are the productions

$$\begin{array}{ccc} S & \to & \epsilon \mid aA \\ A & \to & bS \end{array}$$

we have

$$L(G) = \{(ab)^i \mid i \ge 0\}$$

= \{\epsilon, ab, abab, ababab, abababab, \ldots\}

Simple Arithmetic Expressions

 $SAE = (N = \{E, I, D\}, T = \{+, *, (,), 0, 1, ..., 9\}, P, E)$ where P is given by:

Note: $A \to \alpha \mid \beta$ shorthand for $A \to \alpha$, $A \to \beta$.
