Yet More SQL SELECT

Database Systems Lecture 9
Natasha Alechina

In This Lecture

- Yet more SQL
 - ORDER BY
 - Aggregate functions
 - GROUP BY and HAVING
 - UNION etc.
- For more information
 - Connoly and Begg Chapter 5
 - Ullman and Widom Chapter 6.4

SQL SELECT Overview

```
SELECT
 [DISTINCT | ALL] <column-list>
 FROM <table-names>
 [WHERE <condition>]
 [ORDER BY <column-list>]
 [GROUP BY <column-list>]
 [HAVING <condition>]
                   ([] - optional, | - or)
```

ORDER BY

- The **ORDER BY** clause **SELECT <columns>**sorts the results of a **FROM <tables>**query **WHERE <condition**
 - You can sort in ascending (default) or descending order
 - Multiple columns can be given

```
SELECT <columns>
FROM <tables>
WHERE <condition>
ORDER BY <cols>
[ASCENDING |
DESCENDING |
ASC | DESC ]
```

ORDER BY Example

Grades

Code	Mark
DBS	56
IAI	72
DBS	60
PR1	43
PR2	35
IAI	54
	DBS IAI DBS PR1 PR2

SELECT * FROM Grades ORDER BY Mark

Name	Code	Mark
Mark	PR2	35
Mark	PR1	43
Jane	IAI	54
John	DBS	56
Mary	DBS	60
John	IAI	72

ORDER BY Example

SELECT * FROM Grades
ORDER BY Code ASC,
Mark DESC

Grades

Name	Code	Mark
John	DBS	56
John	IAI	72
Mary	DBS	60
Mark	PR1	43
Mark	PR2	35
Jane	IAI	54

Constants and Arithmetic

 As well as column names, you can select constants, compute arithmetic expressions and evaluate functions in a SELECT statement SELECT Mark/100 FROM Grades

SELECT
Salary + Bonus
FROM Employee

SELECT 1.175*Price FROM Products

Aggregate Functions

- Aggregate functions compute summaries of data in a table
 - Most aggregate functions (all except count) work on a single column of numeric data
 - Use an alias to name the result

- Aggregate functions
 - count: The number of rows
 - **SUM**: The sum of the entries in a column
 - Avg: The average entry in a column
 - MIN, MAX: The minimum and maximum entries in a column

Aggregate Functions

Grades

Name	Code	Mark
John	DBS	56
John	IAI	72
Mary	DBS	60
Mark	PR1	43
Mark	PR2	35
Jane	IAI	54

SELECT

COUNT(*) AS Count FROM Grades Count

6

SELECT

SUM(Mark) AS Total FROM Grades

Total 320

SELECT

MAX(Mark) AS Best FROM Grades **Best**

72

Aggregate Functions

 You can combine aggregate functions using arithmetic SELECT

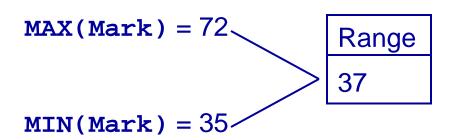

MAX(Mark)-MIN(Mark)

AS Range

FROM Grades

Grades

Name	Code	Mark
John	DBS	56
John	IAI	72
Mary	DBS	60
Mark	PR1	43
Mark	PR2	35
Jane	IAI	54

Example

Modules

Code	Title	Credits
DBS	Database Sys.	10
GRP	Group Project	20
	Programming	10

 Find John's average mark, weighted by the credits of each module

Grades

Name	Code	Mark
John	DBS	60
Mark	GRP	47
Marv	PRG	

SELECT

```
SUM(Mark*Credits)/SUM(Credits)
FROM Modules, Grades
WHERE Modules.Code=Grades.Code
AND Grades.Name = 'John'
```

- Sometimes we want to apply aggregate functions to groups of rows
- Example, find the average mark of each student

The **GROUP BY** clause does this

```
SELECT <cols1>
  FROM <tables>
  GROUP BY <cols2>
```

SELECT <cols1>
 FROM <tables>
GROUP BY <cols2>

- Every entry in
 cols1> must be in
 cols2>, be a
 constant, or be an aggregate function
- You can have where and order by clauses as well as a GROUP by clause

Grades

Name	Code	Mark
John	DBS	56
John	IAI	72
Mary	DBS	60
Mark	PR1	43
Mark	PR2	35
Jane	IAI	54

SELECT Name,

AVG(Mark) AS Average
FROM Grades
GROUP BY Name

Name	Average
John	64
Mary	60
Mark	39
Jane	54

Sales

Month	Department	Value
March	Fiction	20
March	Travel	30
March	Technical	40
April	Fiction	10
April	Fiction	30
April	Travel	25
April	Fiction	20
May	Fiction	20
May	Technical	50

- Find the total value of the sales for each department in each month
 - Can group by Month then Department or Department then Month
 - Same results, but in a different order

SUM(Value) AS Total FROM Sales

Month	Department	Total
April	Fiction	60
April	Travel	25
March	Fiction	20
March	Technical	40
March	Travel	30
May	Fiction	20
May	Technical	50

SELECT Month, Department, SELECT Month, Department, SUM(Value) AS Total FROM Sales GROUP BY Month, Department GROUP BY Department, Month

Month	Department	Total
April	Fiction	60
March	Fiction	20
May	Fiction	20
March	Technical	40
May	Technical	50
April	Travel	25
March	Travel	30

HAVING

- HAVING is like a
 WHERE clause,
 except that it applies
 to the results of a
 GROUP BY query
- It can be used to select groups which satisfy a given condition

SELECT Name,

AVG(Mark) AS Average

FROM Grades

GROUP BY Name

HAVING AVG(Mark) >= 40

Name	Average
John	64
Mary	60
Jane	54

WHERE and HAVING

- WHERE refers to the rows of tables, and so cannot use aggregate functions
- HAVING refers to the groups of rows, and so cannot use columns which are not in the GROUP BY
- Think of a query being processed as follows:
 - Tables are combined
 - WHERE clauses
 - GROUP BY and Aggregates
 - Column selection
 - HAVING clauses
 - ORDER BY

UNION, etc.

- UNION, INTERSECT, and EXCEPT
 - These treat the tables as sets and are the usual set operators of union, intersection, and difference
 - We'll concentrate on UNION
 - Oracle has MINUS instead of EXCEPT

- They all combine the results from two select statements
- The results of the two selects must have the same columns and data types

UNION

Grades

Name	Code	Mark
Jane	IAI	52
John	DBS	56
John	IAI	72
Mark	PR1	43
Mark	PR2	35
Mary	DBS	60

 Find, in a single query, the average mark for each student, and the average mark overall

UNION

 The average for each
 The average overall student:

```
SELECT Name,
   AVG(Mark) AS Average
 FROM Grades
GROUP BY Name
```

SELECT

'Total' AS Name, AVG(Mark) AS Average FROM Grades

 Note - this has the same columns as the average by student

UNION

SELECT Name
AVG(Mark) AS Average
FROM Grades
GROUP BY Name

UNION

SELECT
'Total' as Name,
AVG(Mark) AS Average
FROM Grades

Name	Average
Jane	52
John	64
Mark	39
Mary	60
Total	53

A Final Example

- Examiners' reports
 - We want a list of students and their average mark
 - For first and second years the average is for that year
 - For finalists it is 40% of the second year plus 60% of the final year average.

- We want the results
 - Sorted by year then average mark (High to low) then last name, first name, and finally ID
 - To take into account the number of credits each module is worth
 - Produced by a single query

Tables for the Example

Student

ID First Last Year

Grade

ID Code Mark YearTaken

Module

Code Title Credits

We'll Need a UNION

- Finalists are treated differently
 - Write one query for the finalists
 - Write a second query for the first and second years
 - Use a UNION to join them together

<QUERY FOR FINALISTS>

UNION

<QUERY FOR OTHERS>

We'll need to Join the Tables

- Both of the subqueries need information from all the tables
 - The student ID, name and year
 - The marks for each module and the year taken
 - The number of credits for each module

- This is a natural join operation
 - We could use a NATURAL JOIN statement, and hope that our version of SQL can do it
 - Safer to just use a WHERE clause

The Query So Far

```
SELECT <some information>
  FROM Student, Module, Grade
 WHERE Student, ID = Grade, ID
   AND Module.Code = Grade.Code
   AND <student is in third year>
UNION
SELECT <some information>
  FROM Student, Module, Grade
 WHERE Student.ID = Grade.ID
   AND Module.Code = Grade.Code
   AND <student is in first or second year>
```

Information for Finalists

- We need to retrieve
 - Compute average mark, weighted 40-60 across years 2 and 3
 - First year marks need to be ignored
 - The ID, Name, and Year are needed as they are used for ordering

- The average is hard
 - We don't have any statement to separate years 2 and 3 easily
 - We can exploit the fact that 40 = 20*2 and 60 = 20*3, so YearTaken and the weighting have a simple relationship

Information for Finalists

Information for Other Students

- Other students are easier than finalists
 - We just need to average their marks where YearTaken and Year are the same
 - As before we need the ID, Name, and Year for ordering

Information for Other Students

The Final Query

```
SELECT Year, Student.ID, Last, First,
       SUM((20*YearTaken/100)*Mark*Credits)/120 AS AverageMark
 FROM Student, Module, Grade
WHERE Student.ID = Grade.ID AND Module.Code = Grade.Code
  AND YearTaken IN (2.3) AND Year = 3
GROUP BY Year, Student.ID, First, Last
UNION
SELECT Year, Student.ID, Last, First,
        SUM(Mark*Credits)/120 AS AverageMark
  FROM Student, Module, Grade
 WHERE Student.ID = Grade.ID AND Module.Code = Grade.Code
   AND YearTaken = Year AND Year IN (1,2)
 GROUP BY Year, Student.ID, First, Last
ORDER BY Year desc, AverageMark desc, First, Last, ID
```

Next Lecture

- Missing Information
 - NULLs and three-valued logic
 - NULLs and the relational model
 - OUTER JOINs
 - Default values
