

Test on inheritance, abstraction and polymorphism

```
import java.awt.*;  
  
interface Displayable{  
  
    public void display(int x, int y);  
    public void display(int x, int y, int i);  
  
}  
  
interface Movable{  
  
    public void moveLeft();  
    public void moveRight();  
    public void moveUp();  
    public void moveDown();  
}  
  
abstract class CartoonPart implements Displayable{  
  
    private Image[] images;  
    public void display(int x, int y){  
        // code which displays the default image  
    }  
  
    public void display(int x, int y, int i){  
        // code which displays the ith image  
    }  
  
}  
  
abstract class CartoonCharacter extends CartoonPart implements Movable{  
  
    abstract public void moveLeft();  
    abstract public void moveRight();  
    abstract public void moveUp();  
    abstract public void moveDown();  
  
    public void jumpUpNDown(){  
        moveUp();  
        moveDown();  
    }  
  
    public void panic(){  
        moveLeft();  
        moveRight();  
        jumpUpNDown();  
    }  
}
```

```

class House extends CartoonPart{

    public void doorOpen() {
        // show the picture of house with the door open
    }

    public void doorClose() {
        // show the picture of house with the door closed
    }

    public void fallDown() {
        // collapse in ruins
    }

}

class Duck extends CartoonCharacter{
// code for methods moveLeft(), moveRight(), moveUp(), moveDown()
}

class Rabbit extends CartoonCharacter{
// code for methods moveLeft(), moveRight(), moveUp(), moveDown()
}

class Wolf extends CartoonCharacter{
// code for methods moveLeft(), moveRight(), moveUp(), moveDown()
}

class Hunter extends CartoonCharacter{
// code for methods moveLeft(), moveRight(), moveUp(), moveDown()
}

```

Questions:

1. Does an object of type House have `display(int x, int y)` method?
2. Does an object of type House have `moveLeft()` method?
3. Does an object of type Hunter have `images` field?
4. Does an object of type Hunter have `panic` method?
5. Suppose that a method has the following signature:
`public static void animation(Displayable[] m)`
and variable `ducks` is of type `CartoonCharacter[]`. Would the compiler report an error if we pass `ducks` to `animation`, i.e. call `animation(ducks)`?
6. What if in the example above `ducks` is of type `CartoonPart[]`?
7. What if we have a method
`public static void parade(CartoonCharacter[] c)`
and `ducks` is of type `Displayable[]` and we call `parade(ducks)`?
8. What if in the example above `ducks` is of type `Duck[]`?
