

Yampa: Functional Reactive Programming for Systems with Dynamic Structure

Henrik Nilsson

University of Nottingham, UK

Yampa: Functional Reactive Programming for Systems with Dynamic Structure – p.1/5

Reactive programming

Reactive systems:

- input arrives incrementally while system is running
- output is generated in response to input in an interleaved fashion

(Contrast **transformational systems**.)

The notions of

- time
- time-varying entities, **signals**

are inherent.

Yampa: Functional Reactive Programming for Systems with Dynamic Structure – p.2/5

Functional Reactive Programming

Functional Reactive Programming (FRP)

- Framework for reactive programming in a functional setting.
- Systems described by mapping **signals** to **signals**.
- Supports hybrid systems (continuous and discrete time).
- Supports systems with evolving structure.
- Originated from Functional Reactive Animation (Fran) (Elliott & Hudak).

Yampa: Functional Reactive Programming for Systems with Dynamic Structure – p.3/5

Related languages

FRP related both to modeling and synchronous dataflow languages:

- Modeling Languages:
 - Simulink
 - Ptolemy II
 - Modelica
- Synchronous languages:
 - Esterel
 - Lustre
 - Lucid Sychrone

Yampa: Functional Reactive Programming for Systems with Dynamic Structure – p.4/5

FRP applications

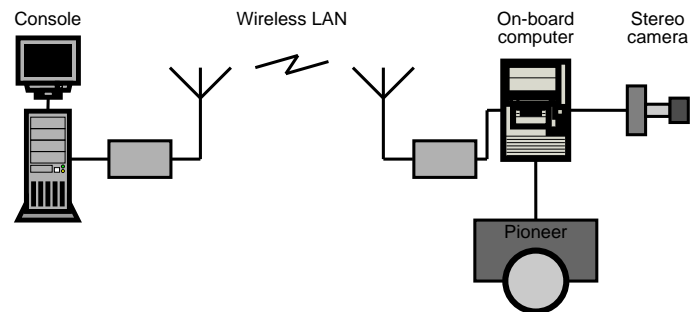

Some domains where FRP has been used:

- Graphical Animation (Fran: Elliott, Hudak)
- Robotics (Frob: Peterson, Hager, Hudak, Elliott, Pembeci, Nilsson)
- Vision (FVission: Peterson, Hudak, Reid, Hager)
- GUIs (Fruit: Courtney)
- Hybrid modeling (Nilsson, Hudak, Peterson)

Example: Robotics (1)

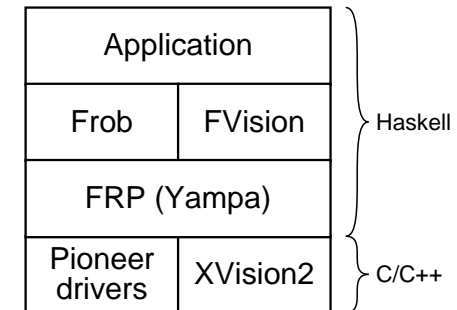

[PPDP'02, with Izzet Pembeci and Greg Hager, Johns Hopkins University]

Hardware setup:

Example: Robotics (2)

Software architecture:

Example: Robotics (3)

Yampa

The most recent Yale FRP implementation is called **Yampa**:

- Embedding in Haskell; i.e. a Haskell library.
- Clear separation between signals and functions on signals.
- Arrows used as the basic structuring framework.
- Advanced switching constructs allows for description of systems with highly dynamic structure.

Yampa?

Yampa is a river with long calmly flowing sections and abrupt whitewater transitions in between.

A good metaphor for hybrid systems!

Signal functions

Key concept: functions on signals.

Intuition:

```
Signal  $\alpha \approx \text{Time} \rightarrow \alpha$   
 $x :: \text{Signal T1}$   
 $y :: \text{Signal T2}$   
 $f :: \text{Signal T1} \rightarrow \text{Signal T2}$ 
```

Additionally: **causality** requirement.

Signal functions and state

Alternative view:

Functions on signals can encapsulate state.

$state(t)$ summarizes input history $x(t')$, $t' \in [0, t]$.

Functions on signals are either:

- **Stateful**: $y(t)$ depends on $x(t)$ and $state(t)$
- **Stateless**: $y(t)$ depends only on $x(t)$

Signal functions in Yampa

- Signal functions are **first class entities**.
Intuition: $SF\ \alpha\ \beta \approx Signal\ \alpha \rightarrow Signal\ \beta$
- Signals are **not** first class entities: they only exist indirectly through signal functions.
- The strict separation between signals and signal functions distinguishes Yampa from earlier FRP implementations.

Yampa: Functional Reactive Programming for Systems with Dynamic Structure – p.13/5

Describing systems

Systems are described by combining signal functions into larger signal functions:

Yampa: Functional Reactive Programming for Systems with Dynamic Structure – p.14/5

Yampa and arrows

Yampa uses John Hughes' **arrow** framework:
Signal functions are arrows.

Core signal function combinators:

- $arr :: (a \rightarrow b) \rightarrow SF\ a\ b$
- $>>> :: SF\ a\ b \rightarrow SF\ b\ c \rightarrow SF\ a\ c$
- $first :: SF\ a\ b \rightarrow SF\ (a,c)\ (b,c)$
- $loop :: SF\ (a,c)\ (b,c) \rightarrow SF\ a\ b$

Enough to express any conceivable “wiring”.

Yampa: Functional Reactive Programming for Systems with Dynamic Structure – p.15/5

The arrow syntactic sugar

Using the basic combinators directly is often very cumbersome. Ross Paterson's syntactic sugar for arrows provides a convenient alternative:

```
proc pat -> do [ rec ]
  pat1 <- sfexp1 -< exp1
  pat2 <- sfexp2 -< exp2
  ...
  patn <- sfexpn -< expn
  returnA -< exp
```

Also: $let\ pat = exp \equiv pat -< arr\ id -< exp$

Yampa: Functional Reactive Programming for Systems with Dynamic Structure – p.16/5

Some basic signal functions

- `identity :: SF a a`
`identity = arr id -- semantics`
- `constant :: b -> SF a b`
`constant b = arr (const b) -- semant`
- `integral :: VectorSpace a s->SF a a`
- `time :: SF a Time`
`time = constant 1.0 >>> integral`
- `(^<<) :: (b->c) -> SF a b -> SF a c`
`f (^<<) sf = sf >>> arr f`

Yampa: Functional Reactive Programming for Systems with Dynamic Structure – p.17/5

A bouncing ball

$$y = y_0 + \int \dot{y} dt$$

$$\dot{y} = \int -9.81$$

On impact:

$$\dot{y} = -\dot{y}(t-)$$

(fully elastic collision)

Yampa: Functional Reactive Programming for Systems with Dynamic Structure – p.18/5

Modelling the bouncing ball: part 1

Free-falling ball:

```
type Pos = Double
type Vel = Double
```

```
fallingBall ::
  Pos -> Vel -> SF () (Pos, Vel)
fallingBall p0 v0 = proc () -> do
  v <- (v0 +) ^<< integral -< -9.81
  p <- (p0 +) ^<< integral -< v
  returnA -< (p, v)
```

Yampa: Functional Reactive Programming for Systems with Dynamic Structure – p.19/5

Events

Conceptually, **discrete-time** signals are only defined at discrete points in time, often associated with the occurrence of some **event**.

Yampa models discrete-time signals by lifting the **range** of continuous-time signals:

```
data Event a = NoEvent | Event a
Discrete-time signal = Signal (Event a).
```

We often want to associate information with an event occurrence:

```
tag :: Event a -> b -> Event b
```

Yampa: Functional Reactive Programming for Systems with Dynamic Structure – p.20/5

Some basic event sources

- `never :: SF a (Event b)`
- `now :: b -> SF a (Event b)`
- `after :: Time -> b -> SF a (Event b)`
- `repeatedly :: Time -> b -> SF a (Event b)`
- `edge :: SF Bool (Event ())`

Stateful event suppression

- `notYet :: SF (Event a) (Event a)`
- `once :: SF (Event a) (Event a)`

Modelling the bouncing ball: part 2

Detecting when the ball goes through the floor:

```
fallingBall' ::  
  Pos -> Vel  
  -> SF () ((Pos, Vel), Event (Pos, Vel))  
fallingBall' p0 v0 = proc () -> do  
  pv@(p, _) <- fallingBall p0 v0 -< ()  
  hit      <- edge          -< p <= 0  
  returnA -< (pv, hit `tag` pv)
```

Switching

- Q:** How and when do signal functions “start”?
- A:**
- **Switchers** “apply” a signal functions to its input signal at some point in time.
 - This creates a “running” signal function **instance**, which often replaces the previously running instance.

Switchers thus allow systems with **varying structure** to be described.

The basic switch

Idea:

- Allows one signal function to be replaced by another.
- Switching occurs on the first occurrence of the switching event source.

```
switch ::
```

```
SF a (b, Event c)  
-> (c -> SF a b)  
-> SF a b
```

Modelling the bouncing ball: part 3

Making the ball bounce:

```
bouncingBall :: Pos -> SF () (Pos, Vel)  
bouncingBall p0 = bbRec p0 0.0  
where  
  bbRec p0 v0 =  
    switch (fallingBall' p0 v0) $ \ (p,v) ->  
      bbRec p (-v)
```

Simulation of bouncing ball

Highly dynamic system structure?

Basic switch allows one signal function to be replaced by another.

- What about more general structural changes?

- What about state?

The challenge

George Russel said on the Haskell GUI list:

“... Things like getting an alien spaceship to move slowly downward, moving randomly to the left and right, and bouncing off the walls, turned out to be a major headache. Also I think I had to use ‘error’ to get the message out to the outside world that the aliens had won. ...”

Yampa: Functional Reactive Programming for Systems with Dynamic Structure – p.29/5

What was wrong?

Possible reasons for George Russel’s reaction:

- Original reactive animation systems like Fran and FAL lacked crucial features, like dynamic collections of signal functions.
[Yampa attempts to address this \[Haskell Workshop '02\]](#)
- Not many examples of good FRP code around.
[\[Haskell Workshop '03\]](#)

Yampa: Functional Reactive Programming for Systems with Dynamic Structure – p.30/5

The game

Yampa: Functional Reactive Programming for Systems with Dynamic Structure – p.31/5

Describing the alien behavior (1)

```
type Object = SF ObjInput ObjOutput

alien :: RandomGen g =>
  g -> Position2 -> Velocity -> Object
alien g p0 vvd = proc oi -> do
  rec
    -- Pick a desired horizontal position
    rx  <- noiseR (xMin, xMax) g -< ()
    smp1 <- occasionally g 5 () -< ()
    xd  <- hold (point2X p0) -< smp1 `tag` rx
    ...
```

Yampa: Functional Reactive Programming for Systems with Dynamic Structure – p.32/5

Describing the alien behavior (2)

```
...
-- Controller
let axd = 5 * (xd - point2X p)
    - 3 * (vector2X v)
    ayd = 20 * (vyd - (vector2Y v))
    ad = vector2 axd ayd
    h = vector2Theta ad
...
```

Describing the alien behavior (3)

```
...
-- Physics
let a = vector2Polar
    (min alienAccMax
     (vector2Rho ad))
    h
vp <- iPre v0 -< v
ffi <- forceField -< (p, vp)
v <- (v0 ^^) ^<< impulseIntegral
    -< (gravity ^^ a, ffi)
p <- (p0 .+^) ^<< integral -< v
...
```

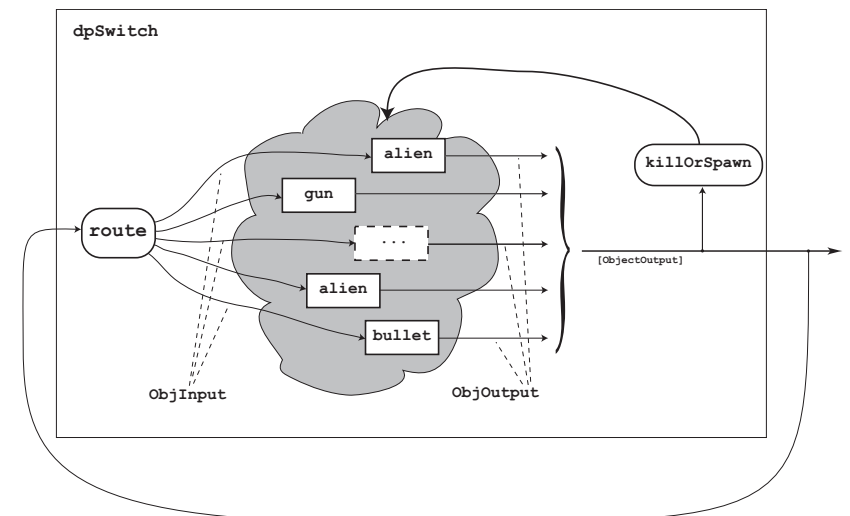

Describing the alien behavior (4)

```
...
-- Shields
sl <- shield -< oiHit oi
die <- edge -< sl <= 0

returnA -< ObjOutput
    ooObsObjState = oosAlien p h v,
    ooKillReq     = die,
    ooSpawnReq    = noEvent

where
    v0 = zeroVector
```

Overall game structure

Dynamic signal function collections

Idea:

- Switch over **collections** of signal functions.
- On event, “freeze” running signal functions into collection of signal function **continuations**, preserving encapsulated **state**.
- Modify collection as needed and switch back in.

Dynamic signal function collections

dpSwitch

Need ability to express:

- How input routed to each signal function.
- When collection changes shape.
- How collection changes shape.

```
dpSwitch :: Functor col =>
  (forall sf . (a -> col sf -> col (b,sf)))
-> col (SF b c)
-> SF (a, col c) (Event d)
-> (col (SF b c) -> d -> SF a (col c))
-> SF a (col c)
```

Routing

Idea:

- The routing function decides which parts of the input to pass to each running signal function instance.
- It achieves this by pairing a projection of the input with each running instance:

The routing function type

Universal quantification over the collection members:

```
Functor col =>
  (forall sf . (a -> col sf -> col (b,sf)))
```

Collection members thus **opaque**:

- Ensures only signal function instances from argument can be returned.
- Unfortunately, does not prevent duplication or discarding of signal function instances.

The game core

```
gameCore :: IL Object
           -> SF (GameInput, IL ObjOutput)
           (IL ObjOutput)

gameCore objs =
  dpSwitch route
    objs
  (arr killOrSpawn >>> notYet)
  (\sfs' f -> gameCore (f sfs'))
```

Closing the feedback loop (1)

```
game :: RandomGen g =>
  g -> Int -> Velocity -> Score ->
  SF GameInput ((Int, [ObsObjState]),
                Event (Either Score Score))

game g nAliens vydAlien score0 = proc gi -> do
  rec
    oos <- gameCore objs0 -< (gi, oos)
  score <- accumHold score0
                -< aliensDied oos
  gameOver <- edge -< alienLanded oos
  newRound <- edge -< noAliensLeft oos
```

Closing the feedback loop (2)

```
...
returnA -< ((score,
             map ooObsObjState
               (elemsIL oos)),
           (newRound `tag` (Left score))
           `lMerge` (gameOver
                    `tag` (Right score)))

where
  objs0 =
    listToIL
      (gun (Point2 0 50)
       : mkAliens g (xMin+d) 900 nAliens)
```

Other approaches?

Transition function operating on world model with explicit state (e.g. Asteroids by Lüth):

- Model snapshot of world with **all** state components.
- Transition function takes input and current world snapshot to output and the next world snapshot.

One could also use this technique **within** Yampa to avoid switching over dynamic collections.

Why use Yampa, then?

- Yampa provides a lot of functionality for programming with time-varying values:
 - captures common patterns
 - packaged in a way that makes reuse very easy
- Yampa allows state to be nicely encapsulated by signal functions:
 - avoids keeping track of all state globally
 - adding more state is easy and usually does not imply any major changes to type or code structure

State in alien

Each of the following signal functions used in `alien` encapsulate state:

- `noiseR`
- `impulseIntegral`
- `occasionally`
- `integral`
- `hold`
- `shield`
- `iPre`
- `edge`
- `forceField`

Drawbacks of Yampa?

- Choosing the right switch can be tricky.
- Subtle issues concerning when to use e.g. `iPre`, `notYet`.
- Syntax could be improved (with specialized pre-processor).
