# COMP2012/G52LAC Languages and Computation Lecture 11

Disambiguating Context-Free Grammars

Henrik Nilsson

University of Nottingham

COMP2012/G52LACLanguages and ComputationLecture 11 – p.1/8

#### **Recap: Derivation Trees (2)**

- The string of *leaf labels* read from left to right, eliding any  $\epsilon$ , constitute the *yield* of the tree.
- For a CFG G=(N,T,P,S), a string  $\alpha\in (N\cup T)^*$  is the yield of some derivation tree iff  $S\overset{*}{\Rightarrow}\alpha$ .

### **Recap: Derivation Trees (1)**

A tree is a *derivation tree* for a CFG G = (N, T, P, S) iff

- 1. Every node has a label from  $N \cup T \cup \{\epsilon\}$ .
- 2. The label of the root node is S.
- 3. Labels of interior nodes belong to N.
- 4. If a node n has label A and nodes  $n_1, n_2, \ldots, n_k$  are children of n, from left to right, with labels  $X_1, X_2, \ldots X_k$ , respectively, then  $A \to X_1 X_2 \ldots X_k$  is a production in P.
- 5. If a node n has label  $\epsilon$ , then n is a leaf and the only child of its parent.

COMP2012/G52LACLanguages and ComputationLecture 11 - p.2/8

## **Recap:** Ambiguity (1)

A CFG G = (N, T, P, S) is *ambiguous* is there is at least one word  $w \in L(G)$  such that there are

- two different derivation trees, or
- two different left-most derivations, or
- two different right-most derivations

for w.

### **Recap: Ambiguity (2)**

Ambiguity can be problematic for a number of reasons, including that the structure of a derivation tree often is used to suggest a *meaning* for the word.

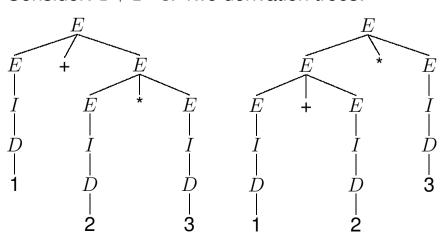

**Example: Arithmetic Expressions** 

Another reason is that many (especially efficient) parsing methods are not applicable if the grammar is ambiguous.

COMP2012/G52LACLanguages and ComputationLecture 11 – p.5/8

## **Recap:** Ambiguity (4)

Consider: 1 + 2 \* 3. Two derivation trees:

### **Recap:** Ambiguity (3)

 $SAE = (N = \{E, I, D\}, T = \{+, *, (,), 0, 1, \dots 9\}, P, E)$  where P is given by:

COMP2012/G52LACLanguages and ComputationLecture 11 - p.6/8

## **Disambiguating Grammars**

Given an ambiguous grammar G, it is often possible to construct an *equivalent* grammar G' (i.e., L(G) = L(G')), such that G' is *not* ambiguous.

Some languages are *inherently ambiguous* CFLs, meaning that every CFG generating the language necessarily is ambiguous.

We will consider exploiting

- Operator Precedence
- Associativity

to disambiguate expression grammars as an example.
